-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 09 December 2002.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-127 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-127 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☒ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-101, 122-127 are rejected under 35 U.S.C. 102(e) as being anticipated by Sankey U.S. patent No 6,400,291 B1.

As per claims 1 and 26, Sankey discloses an apparatus for receiving and processing a CDR signal comprising: logic combinational is the same as the claimed (PLD circuitry) (see fig.4); first input circuitry (see fig.4 element 100 and col.5, lines 45-46) configured to receive the CDR (see element 94) signal; second input circuitry configured to receive a reference clock signal (see fig.4 element 120 and col.5, lines 45-67); and processing circuitry at least partly controlled by the PLD circuitry and configured to use the reference clock signal to recover data information from the CDR signal (see fig.4 element 96).

As per claims 2 and 27, Sankey does teach Wherein the PLD circuitry, the first and second input circuitries, and the processing circuitry are all integrated in a single integrated circuit device. (See col.2, lines 19-31)

As per claims 3 and 28, Sankey inherently teaches wherein the first input circuitry comprises: phase locked loop circuitry.

Art Unit: 2631

As per claims 4 and 29, Sankey inherently teaches wherein the phase locked loop circuitry is programmable With respect to an operating parameter.

As per claims 5 and 30, Sankey inherently teaches wherein the phase locked loop circuitry is configured to power down in response to a programmable power down signal.

As per claim 6, Sankey does teach wherein the second input circuitry comprises: phase locked loop circuitry (see fig.4 element 124).

As per claim 7, Sankey inherently teaches wherein the phase locked loop circuitry is programmable with respect an Operating parameter.

As per claim 8, Sankey inherently teaches wherein the phase locked loop circuitry is configured to power down in response to a programmable power down signal.

As per claim 9, Sankey does teach wherein the first input circuitry comprises: further phase locked loop circuitry configured to receive an output signal of the phase locked loop circuitry and to produce a recovered clock signal that synchronized With the CDR signal (see fig.4).

As per claim 10, Sankey does teach wherein the further phase locked loop circuitry is further configured to adjust the phase of the output signal of the phase locked loop circuitry to produce the recovered clock signal (see fig.4).

As per claim 11, Sankey does teach wherein the processing circuitry comprises: deserializer circuitry configured to convert the data information from serial parallel form (see fig.3 element 96).

As per claim 12, Sankey inherently teaches wherein the deserializer circuitry is programmable with respect to an operating parameter.

Art Unit: 2631

As per claim 13, Sankey inherently teaches wherein the deserializer circuitry is further configured to reset in response to a reset signal selectively produced by the PLD circuitry.

As per claim 14, Sankey does teach wherein the processing circuitry comprises: buffer circuitry (see fig.4 elements 102, 104) configured to buffer the data information between a clock regime associated with reference clock signal and a different clock regime.

As per claim 15, Sankey inherently teaches wherein the buffer circuitry is further configured to signal selectively to reset in response a reset produced by the PLD circuitry.

As per claim 16, Sankey inherently teaches wherein at least one of the first input, second input and processing circuitries is configured to apply to the PLD circuitry a condition-monitoring signal indicative of an operating condition of that at least one circuitry.

As per claim 17, Sankey inherently teaches wherein at least one of the first input, second input, and processing circuitries includes a component that reset by a reset signal selectively produced by the PLD circuitry.

As per claim 18, Sankey inherently teaches wherein the first input circuitry further configured for alternate use receive a non-CDR data signal; the second input circuitry is further configured for alternate use to receive a non-CDR clock signal that is synchronized with the non-CDR data signal; and the processing circuitry further configured for alternate use derive the data information from the non-CDR data signal using the non-CDR clock signal.

Art Unit: 2631

As per claim 19, Sankey inherently teaches wherein the non-CDR data signal is an LVDS signal.

As per claim 20, Sankey inherently teaches further comprising: output circuitry configured to receive further data information from the PLD circuitry and to use the reference clock signal to encode the further data information as a further CDR signal for output by the apparatus.

As per claim 21, Sankey inherently teaches further comprising: loop-back circuitry configured selectively uses the further CDR signal as the CDR signal.

As per claim 22, Sankey inherently teaches wherein the loop-back circuitry is configured so that it can be controlled by a signal from the PLD circuitry.

As per claim 23, Sankey inherently teaches further comprising: loop-back circuitry configured to selectively route the CDR signal for output by the apparatus in lieu of the further CDR signal.

As per claim 24, Sankey inherently teaches wherein the loop-back circuitry is configured so that it can be controlled by a signal from the PLD circuitry.

As per claim 25, Sankey inherently teaches wherein the loop-back circuitry is further configured for selective control by the PLD circuitry.

As per claim 31, Sankey inherently teaches wherein the output circuitry comprises: buffer circuitry configured to buffer the data information between a clock regime associated with the PLD circuitry and a different clock regime associated With the reference clock signal.

Art Unit: 2631

As per claim 32, Sankey inherently teaches wherein the output circuitry comprises: serializer circuitry configured to convert the data information from parallel to serial form.

As per claim 33, Sankey inherently teaches wherein the serializer circuitry is programmable with respect to an operating parameter.

As per claim 34, Sankey inherently teaches wherein at least one of the input and output circuitries is configured to apply to the PLD circuitry condition-monitoring signal indicative of an operating condition of that at least one circuitry.

As per claim 35, Sankey inherently teaches wherein at least one of the input and output circuitries includes a component that is reset by a reset signal selectively produced by the PLD circuitry.

As per claim 36, Sankey inherently teaches wherein the PLD circuitry is further configured to produce a non-CDR clock signal synchronized with the data information, and wherein the output circuitry is further configured for alternative use outputting the data information non-CDR form in parallel with the non-CDR clock signal.

As per claim 37, Sankey inherently teaches wherein output circuitry is further configured to selectively frequency-scale the non-CDR clock signal by a predetermined scale factor prior to outputting the non-CDR clock signal frequency-scaled form.

As per claim 38, Sankey inherently teaches wherein output circuitry is programmable with respect to the scale factor.

As per claim 39, Sankey inherently teaches wherein the non-CDR form of the data information is an LVDS signal.

Art Unit: 2631

As per claims 40 and 71, Sankey teaches an apparatus for receiving an information signal which includes data information having clock information the data information embedded in the data information comprising: first input circuitry configured receive the information signal (see fig.4 element 100); second input circuitry configured receive a reference clock signal (see fig.4 element 120) having a reference frequency which is related to frequency of the clock information by a predetermined scale factor; reference clock signal processing circuitry (see fig.4 element 94) configured to use the information signal and the reference clock signal to produce recovered clock signal (see fig.4 element 104) having phase and frequency which respectively correspond to a phase and frequency of the clock information; and data recovery circuitry (see fig.4 element 96) configured to use the recovered clock signal and the information signal to produce a data output signal indicative of the data information in the information signal.

As per claims 41 and 72, Sankey inherently teaches further configured to be programmable with respect to the scale factor.

As per claim 42, Sankey teaches: deserializer (see fig.3 element 96) circuitry configured to convert the data output signal to a plurality of parallel data sub signals, each of which represents a respective portion of the data information indicated by the data output signal.

As per claim 43, Sankey inherently teaches wherein the de-serializer circuitry is programmable With respect to how many parallel data sub-signals are produced.

As per claim 44, Sankey teaches further comprising: synchronizer circuitry (see fig.2 element 60) configured to convert the data output signal to a further data output signal synchronized with a read control signal which can have phase and frequency

Art Unit: 2631

substantially unrelated to the phase and frequency of the reference clock signal and the recovered clock signal.

As per claim 45, Sankey inherently teaches further comprising: selection circuitry configured to select as final data output signal either the data output signal or the further data output signal.

As per claim 46, Sankey inherently teaches wherein the reference clock signal processing circuitry is further configured to use the scale factor producing the recovered clock signal.

As per claim 47, Sankey inherently teaches wherein the reference clock signal processing circuitry is programmable with respect to the scale factor.

As per claim 48, Sankey inherently teaches wherein the information signal is applied to the first input circuitry as a pair of differential signals, and wherein the first input circuitry comprises differential driver circuitry configured to use the differential signals to produce a single output signal for further processing by the apparatus.

As per claim 49, Sankey inherently teaches wherein the reference clock signal is applied to the second input circuitry as a pair of differential signals: and Wherein the second input circuitry comprises differential driver circuitry configured to use the differential signals to produce a single output signal for further processing the apparatus.

As per claim 50, Sankey inherently teaches wherein the reference clock signal processing circuitry comprises: phase locked loop circuitry configured to use the reference clock signal and the scale factor to produce a plurality of candidate further reference clock signals, each having the frequency of the clock information and having a

Art Unit: 2631

phase which is different from the phases of the other candidate further reference clock signals.

As per claim 51, Sankey inherently teaches wherein the reference clock signal processing circuitry further comprises: further phase locked loop circuitry configured use the information signal and the candidate further reference clock signals to produce the recovered clock signal.

As per claim 52, Sankey inherently teaches wherein the further phase locked loop circuitry comprises: selection circuitry configured to select as the recovered clock signal the one of the candidate reference clock signals having the phase that works best with the phase of the clock information.

As per claim 53, Sankey inherently teaches the data recovery circuitry comprises: register circuitry having a data input terminal to which the information signal is applied and clock input terminal to which the recovered clock signal applied, the register circuitry being configured to store and output samples of the signal applied to the data input terminal in synchronism with the signal applied to the clock input terminal.

As per claim 54, Sankey inherently teaches the data recovery circuitry further comprises: buffer memory circuitry configured to store multiple successive signal samples output by the register in synchronism with the recovered clock signal and 'to output those samples the same order in response to another separate read clock signal.

As per claim 55, Sankey inherently teaches wherein the information signal represents successive words of J serial bits of data, and wherein the data recovery circuitry comprises: shift register circuitry having a plurality of serially connected stages and configured to shift in successive samples of the information signal synchronism with

Art Unit: 2631

the recovered clock signal; frequency divider circuitry configured to divide the recovered clock signal by J to produce a further reference clock signal; and unload circuitry configured to unload all stages the shift register circuitry in parallel word form in synchronism with the further reference clock signal.

As per claim 56, Sankey inherently teaches divider circuitry is programmable wherein the frequency with respect to J.

As per claim 57, Sankey inherently teaches wherein the data recovery circuitry further comprises: buffer memory circuitry configured to store multiple successive parallel words from the unload circuitry in synchronism with the still further reference clock signal and to output those parallel words in a same order in response to another separate read clock signal.

As per claim 58, Sankey inherently teaches further comprising: PLD circuitry configured to use the data output signal.

As per claim 59, Sankey inherently teaches wherein all of the circuitries are disposed on a single integrated circuit.

As per claim 60, Sankey inherently teaches further comprising: routing circuitry configured to selectively apply a signal indicative of the recovered clock signal to the PLD circuitry.

As per claim 61, Sankey inherently teaches further comprising: PLD circuitry configured to produce read control signal.

As per claim 62, Sankey inherently teaches wherein the PLD circuitry is further configured to use the data output signal.

Art Unit: 2631

As per claim 63, Sankey inherently teaches first source of the information signal; a second source of the reference clock signal; first connection between the first source and the first input circuitry; and a second connection between the second source and the second input circuitry.

As per claim 64, Sankey inherently teaches wherein the first and second input circuitries are disposed on a common integrated circuit, which does not also include the first and second sources.

As per claim 65, Sankey teaches wherein the information signal is a clock data recovery signal (see fig.4 element 94).

As per claim 66, Sankey inherently teaches further comprising: alternative reference clock signal processing circuitry configured to selectively alternatively produce a further reference clock signal based on the reference clock signal and without regard for the information signal.

As per claim 67, Sankey inherently teaches; a memory coupled to said processing circuitry.

As per claim 68, Sankey inherently teaches a printed circuit board.

As per claim 69, Sankey inherently teaches further comprising: a memory mounted on the printed circuit board and coupled to the apparatus.

As per claim 70, Sankey inherently teaches further comprising: processing circuitry mounted on the printed circuit board and coupled to the apparatus.

As per claim 73, Sankey inherently teaches wherein the data source circuitry configured to produce the data signal as a plurality of parallel data sub signals, each of which represents a respective portion of the data information, and wherein the data signal

Art Unit: 2631

processing circuitry comprises: serializer circuitry configured to convert the plurality of parallel data sub signals to a single serial data signal.

As per claim 74, Sankey inherently teaches wherein the serializer circuitry is programmable with respect to how many parallel data sub signals are converted.

As per claim 75, Sankey teaches wherein the data signal processing circuitry comprises: synchronizer circuitry (see fig.2 element 60) configured to receive the data signal in synchronism with a write control signal and to subsequently output the data signal in synchronism with the further reference clock signal, wherein the write control signal can have phase and frequency which are substantially unrelated to the phase and frequency of the reference clock signal and the further reference clock signal.

As per claim 76, Sankey inherently teaches wherein the data signal processing circuitry further comprises: selection circuitry configured to allow the data signal to selectively bypass the synchronizer circuitry.

As per claim 77, Sankey inherently teaches wherein the reference clock signal processing circuitry is further configured to use the scale factor in producing the further reference clock signal.

As per claim 78, Sankey inherently teaches wherein the reference clock signal processing circuitry is programmable with respect the scale factor.

As per claim 79, Sankey inherently teaches wherein the reference clock signal is applied to the input circuitry as a pair of differential signals, and wherein the input circuitry comprises differential driver circuitry configured to use the differential signals to produce a single output signal further processing by the apparatus.

Art Unit: 2631

As per claim 80, Sankey inherently teaches wherein the data signal processing circuitry comprises differential driver circuitry configured to transmit the information signal as a pair of differential signals.

As per claim 81, Sankey inherently teaches wherein the reference clock signal processing circuitry comprises: phase locked loop circuitry configured to use the reference clock signal and the scale factor to produce the further reference clock signal.

As per claim 82, Sankey inherently teaches wherein the data signal processing circuitry comprises: register circuitry having a data input terminal to which the data signal is applied and clock input terminal to which the further reference clock signal applied, the register circuitry being configured to store samples of the signal applied to the data input terminal and to output those samples in synchronism with the signal applied to the clock input terminal.

As per claim 83, Sankey inherently teaches wherein the data signal comprises a plurality of parallel data sub signals, each of which is indicative of a portion the data information, and wherein the data signal processing circuitry comprises: register circuitry having a plurality of data input terminals to Which the data sub signals are respectively applied and a clock input terminal to which the further reference clock signal is applied, the register circuitry being configured to store samples of the signals applied the data input terminals and to output those samples in series in synchronism with the signal applied to the clock input terminal.

As per claim 84, Sankey inherently teaches Wherein the data signal processing circuitry further comprises: buffer memory circuitry configured store multiple successive samples of each of the data sub signals in response to another separate write clock signal

Art Unit: 2631

and to output those samples in the same order synchronism with the further reference clock signal.

As per claim 85, Sankey inherently teaches wherein the plurality of parallel data sub signals comprises J parallel data sub signals, and wherein the register circuitry comprises: shift register circuitry having a plurality of serially connected stages and configured to shift out contents of those stages in series in synchronism with the further reference clock signal; frequency divider circuitry configured divide the further reference clock signal by J to produce a still further reference clock signal; and load circuitry configured to load, in parallel, all stages of the shift register circuitry with samples of the data sub signals in synchronism with the still further reference clock signal.

As per claim 86, Sankey inherently teaches wherein the frequency divider circuitry is programmable with respect to J.

As per claim 87, Sankey inherently teaches wherein the register circuitry further comprises: buffer memory circuitry configured to store multiple successive parallel words of samples of the data sub signals in response to another separate write clock signal and to output those parallel words a same order in response to the still further reference clock signal.

As per claim 88, Sankey inherently teaches source circuitry comprises PLD wherein the data circuitry.

As per claim 89, Sankey inherently teaches wherein all of the circuitries are disposed on a single integrated circuit.

Art Unit: 2631

As per claim 90, Sankey inherently teaches further comprising: routing circuitry configured to selectively apply a signal indicative of the further reference clock signal to the PLD circuitry.

As per claim 91, Sankey inherently teaches further comprising: PLD circuitry configured to produce the write control signal.

As per claim 92, Sankey inherently teaches wherein the circuitry is further configured to include the data source circuitry.

As per claim 93, Sankey inherently teaches a first source of the reference clock signal; a second receiver of the information signal; a first connection between the first source and the input circuitry; and a second connection between the data signal processing circuitry and the second receiver.

As per claim 94, Sankey inherently teaches wherein the input circuitry and the data signal processing circuitry are disposed on a common integrated circuit, which does not also include the first source and the second receiver.

As per claim 95, Sankey inherently teaches wherein the information signals a clock data recovery signal.

As per claim 96, Sankey inherently teaches further comprising: alternative reference clock signal configured to produce an alternative source circuitry clock signal; signal selection circuitry configured to allow the alternative clock signal to be alternatively selectively used by the data processing circuitry as the further reference clock signal; output circuitry configured to output the alternative clock signal in parallel with the information signal.

Art Unit: 2631

As per claim 97, Sankey inherently teaches wherein the data signal processing circuitry comprises first differential driver circuitry configured to transmit the information signal as a first pair differential signals, and wherein the output circuitry comprises second differential driver circuitry configured to transmit the alternative clock signal as a second pair of differential signals.

As per claim 98, Sankey inherently teaches a memory coupled to said processing circuitry.

As per claim 99, Sankey inherently teaches a printed circuit board.

As per claim 100, Sankey inherently teaches further comprising: a memory mounted on the printed circuit board and coupled to the apparatus.

As per claim 101, Sankey inherently teaches further comprising: processing circuitry mounted on the printed circuit board and coupled to the apparatus.

As per claim 122, Sankey discloses an apparatus for receiving and processing a plurality of CDR signals, each of which includes data information and clock information., comprising: first circuitry (see fig.4 element 94) producing a plurality of candidate recovered clock signals (see fig.4 recovered clock) from a reference clock signal (see fig.4 element 120), the candidate recovered clock signals having phases that are shifted relative to one another; and a plurality of second circuitries (see fig.4 elements 102, 104), each receiving a respective one of the CDR signals and using the candidate reference clock signals to recover the clock information from the CDR signal received by that second circuitry.

As per claim 123, Sankey inherently teaches wherein the clock information of all of the CDR signals has a predetermined common frequency.

Art Unit: 2631

As per claim 124, Sankey inherently teaches wherein the reference clock signal has frequency having a predetermined relationship to the predetermined common frequency.

As per claim 125, Sankey inherently teaches wherein the first circuitry comprises phase locked loop circuitry.

As per claim 126, Sankey inherently teaches wherein each of the second circuitries comprises: selection circuitry that selects at least one of the candidate recovered clock signals that is close in phase to the clock information in the CDR signal received by that second circuitry.

As per claim 127, Sankey inherently teaches wherein each of the second circuitries comprises: selection circuitry that selects one of the candidate recovered clock signals that is closest in phase to the clock information in the CDR signal received by that second circuitry.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Art Unit: 2631

4. Claims 102-121 are rejected under 35 U.S.C. 102(e) as being anticipated by Page U.S. Patent No 6,223,089.

As per claim 102, Page discloses a programmable serializer circuitry comprising: input circuitry that receives a programmable number of input signals in parallel (see figs.2, 3 elements 41, 72 and col.5, lines 31-40); and output circuitry (see figs.2, 3 elements 52, 76) and col.5, lines 35-43) that produces an output signal that is serially indicative of the input signals one after another.

As per claim 103, Page does teach wherein the output signal is synchronized with a first clock (see fig.2 element 1x) signal having a first clock rate, and wherein the circuitry further comprises: clock rate divider circuitry that divides the clock rate by a programmable factor to produce a second clock signal (see fig.2 element 2x) for timing passage of information indicative of the input signals in parallel from the input circuitry to the output circuitry.

As per claim 104, Page inherently teaches wherein the factor is programmable to equal the programmable number.

As per claim 105, Page inherently teaches wherein the input circuitry comprises a predetermined plural quantity of register stages, and wherein the number is programmable to any integer value up to and including the plural quantity.

As per claim 106, Page inherently teaches wherein the register stages store the input signals in parallel.

As per claim 107, Page inherently teaches wherein the register stages further output in parallel to the output circuitry information indicative of the input signals.

Art Unit: 2631

As per claim 108, Page inherently teaches wherein the output circuitry comprises a predetermined plural quantity of register stages, and wherein the number is programmable to any integer value up to and including the plural quantity.

As per claim 109, Page does teach wherein the register stages store in parallel information from the input circuitry indicative of the input signals.

As per claim 110, Page does teach wherein the output circuitry further outputs information from the registers in a predetermined series one after another.

As per claim 111, Page does teach programmable serializer circuitry (see elements 52) and programmable logic circuitry (see element 41) for supplying the input signals.

As per claim 112, Page does teach Programmable deserializer circuitry comprising: input circuitry that receives an input signal serially indicative of plural bits of information one after another and stores a programmable number of successive ones of Chose bits (see col.5, lines 35-45); and output circuitry that produces a plurality of output signals in parallel, each of the output signals being indicative of a respective one of the bits stored by the input circuitry (see figs. 2-3 elements 56, 78 and col.5, lines 45-48).

As per claim 113, Page inherently teaches wherein the input signal is synchronized with a first clock signal having a first clock rate, and wherein the circuitry further com clock rate divider circuitry that divides the clock rate by a programmable factor to produce a second clock signal for timing the passage of information indicative of the bits stored by the input circuitry in parallel from the input circuitry to the output circuitry.

Art Unit: 2631

As per claim 114, Page inherently teaches wherein the factor is programmable to equal the programmable number.

As per claim 115, Page inherently teaches wherein the input circuitry comprises a predetermined plural quantity of register stages, and wherein the number is programmable to any integer value up to and including the plural quantity.

As per claim 116, Page inherently teaches wherein each of the register stages stores one of the bits.

As per claim 117, Page inherently teaches wherein the register stages further output in parallel to the output circuitry information indicative of the bits stored in the register stages.

As per claim 118, Page inherently teaches wherein the output circuitry comprises a predetermined plural quantity of register stages, and wherein the number is programmable to any integer value up to and including the plural quantity.

As per claim 119, Page inherently teaches wherein the register stages store in parallel information from the input circuitry indicative of the bits stored by the input circuitry.

As per claim 120, Page inherently teaches wherein the output circuitry further outputs information from the registers in parallel.

As per claim 121, Page does teach programmable deserializer circuitry (see fig.2 element 56) and programmable logic circuitry (see element 41) for receiving the output signals.

Art Unit: 2631

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Smith U.S. patent NO 5,987,543 teaches a method for communicating digital information.

Couts-Martin et al U.S. patent No 6,259,271 B1 teaches a configuration memory integrated circuit.

Casper et al U.S. patent No 5,838,749 teaches a method an apparatus for extracting an embedded clock from a digital data signal.

Suzuki U.S. patent No 5,256,918 teaches a programmable logic device.

Azaren et al U.S. Patent No 5,357,249 teaches an apparatus and method for high speed flexible multiplexing.

Lee et al U.S. patent No 6,374,361 B1 teaches a Skew-insensitive low voltage.

Jorden U.S. Patent No 5,760,844 teaches a video signal.

De Lange U.S. Patent No 6,091,261 teaches an apparatus and method for programmable delays.

Schrader et al U.S. patent No 5,896,561 teaches a communication network.

Wang et al U.S. patent No 6,292,116 B1 teaches a techniques and circuitry for accurately sampling high frequency data signals.

Whittaker U.S. patent No 6,295,563 B1 teaches a control system.
